

Installing ArcGIS Pro

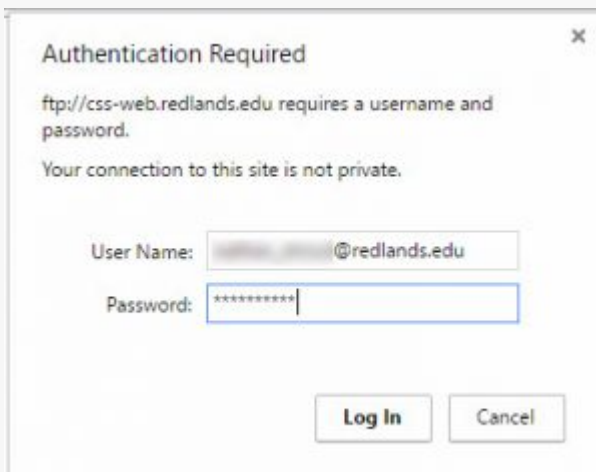

[ArcGIS Pro](#) is the next generation GIS software product coming out of Esri. It has been completely redesigned to be more intuitive with a new ribbon-based user interface (like MS Office), more powerful as a 64-bit application, and opportunities to solve problems in innovative new ways through features such as simultaneous side-by-side 2D & 3D views.

ArcGIS Pro Installation Steps

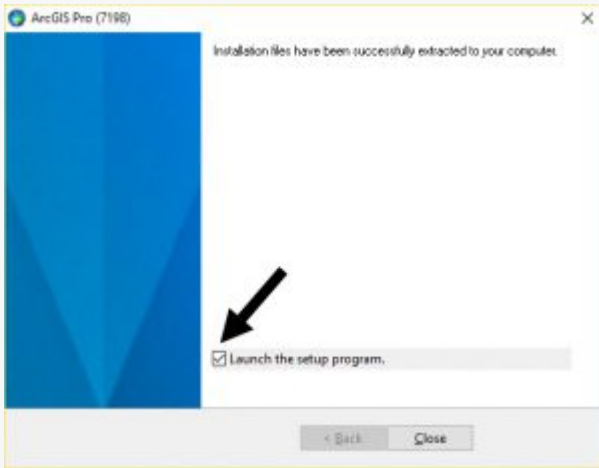

Before installing, please [review the system requirements](#) and run Esri's [Can You Run It? tool](#) to verify that computer you are installing it meets the minimum requirements. While ArcGIS Pro requires a Windows operating system, it can be installed on a Mac in a virtual machine environment by using software such as [Boot Camp](#) or [Parallels](#).

1) Download and run the installer from <ftp://css-web.redlands.edu/software/ArcGISPro/ArcGISPro.exe>. You may be prompted to login – use your University of Redlands email and password.

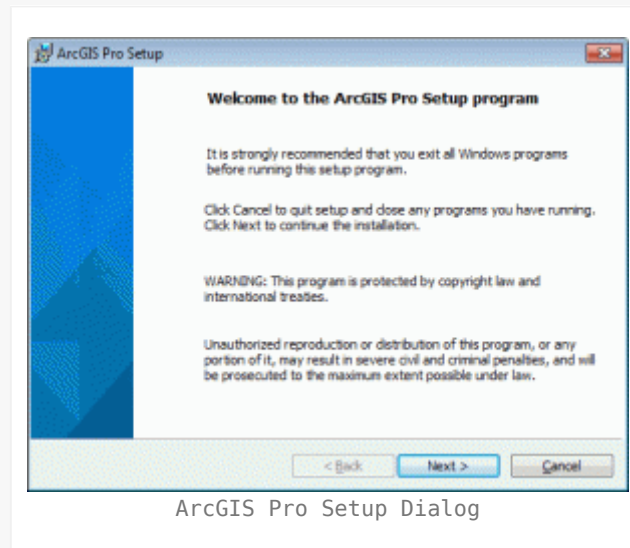

2) Click next, keeping the defaults. This is simply extracting the installer, *not installing ArcGIS Pro*.

3) Confirm that the box is checked next to **Launch the setup program** and click **Close**. This will start the ArcGIS Pro installer.

4) Follow the steps in the setup program to install ArcGIS Pro. We highly recommend that you accept all of the default settings. *Please note that the install process may take some time!*

5) To start using ArcGIS Pro, you will need to provide your ArcGIS Online login information. [Please click here information on how to log in to ArcGIS Pro.](#)

That's it! Now go map like a Pro!
